State of U T A H

Project Title: Statewide Wildlife Management Inventory

Project No. W-65-R-28

Job Title: Statewide Upland Game Inventory and Management

Job No. A-4

Period Covered: December 15, 1978 to April 30, 1980

Abstract: This report includes upland game inventory and harvest data relating to the 1979-80 hunting seasons. Results of annual inventory and harvest surveys and long-term trends of indexes derived by each method are included. Data obtained in 1979 are compared to 1978 and long-term averages.

Objectives: To conduct annual inventories and determine the population trend and annual harvest of upland game.

Procedures: Annual inventory procedures for ring-necked pheasants included winter sex-ratio counts and summer roadside counts. The winter sex-ratio counts were conducted from December 15, 1978, through February 10, 1979, as snow cover conditions allowed. Indexes derived include hen-cock ratios and pheasants observed per 100 hours. Annual summer roadside counts (three or more per route) were conducted from July 22 - August 3 on permanently established routes. Indexes derived include pheasants per mile, young per mile, young per hen, mean brood and percent of hens with young.

Mourning dove breeding population trend was determined via the annual call-count survey. This survey is part of a nation-wide survey administered by the U. S. Fish and Wildlife Service. Call-counts are conducted over 15 permanent, 20-mile routes. One count was made on each route between May 20-30.

Random brood counts were conducted on chukar and Hungarian partridge, forest grouse (ruffed and blue), sage grouse, sharp-tailed grouse, wild turkey and quail from June 15 - August 5. Indexes derived for each species include mean brood size, young per 100 adults and birds observed per 100 hours effort.

Sage grouse strutting ground counts and sharp-tailed grouse dancing ground counts were conducted from March 15 - May 15. Total cocks counted, average cocks per ground and percent change from 1978 for comparable grounds were determined on a county basis.

One Gambel quail call-count route was run in Washington County in late April and early May. Long-period waterhole counts were completed in July and August.

Cottontail rabbit roadside counts were conducted over preestablished routes between July 15 and August 5. Indexes derived include rabbits per mile and young per 100 adults.

Harvest questionnaires were used to determine the harvest of upland game birds, cottontail rabbit and snowshoe hare, band-tailed pigeon, sharp-tailed grouse and wild turkey. An approximate 20 percent sample of eligible licensees from the previous year (1978) license file was selected for the game bird and rabbit and hare questionnaire. Questionnaires were mailed to all band-tailed pigeon, sharp-tailed grouse and wild turkey permittees. Indexes derived include total hunters, hunter-days and harvest plus hunter success per day and for each season.

The game bird and rabbit and hare questionnaires were analyzed by the University of Utah Computer Center. Due to accumulated rounding errors associated with transferring data from the printout, some totals (columns and percentages) may not total exactly.

Beginning in 1979, the program was expanded to report total estimated hunter-days and harvest by species and county rather than just the percent of pressure and harvest. Wild turkey, sharp-tailed grouse and band-tailed pigeon questionnaires were analyzed by the Game Management Section personnel.

Field bag checks of upland game hunters were made primarily at checking stations, with additional random field checks made during each hunting season. Indexes derived include bag per hunter (per day), bag per 100 hours, average hours per hunter-day and average hours per bird bagged. Additional sex and age composition data were compiled for some species using wing samples collected at checking stations.

Recommendations: This project should be continued for the purpose of determining trends of upland game populations and harvest statistics in Utah.

# INTRODUCTION

The objective of Utah's upland game management program is to provide recreational hunting opportunity for sportsmen within the limits of the annual harvestable surplus for each species. It is based on the knowledge that populations of upland game experience relatively high rates of annual turnover. High reproductive rates are naturally compensated for by high death rates, whether hunting is allowed or not. Annual surveys are conducted to measure the production, trend and harvest of each upland game population hunted.

This is the ninth edition of this annual Upland Game Report. It is a consolidation of, and annual performance report for, information compiled during inventory and harvest surveys conducted under Federal Aid Project, W-65-R, Job A-4. Information contained herein was compiled by conservation officers, biologists, game managers and the upland game management staff of the Division of Wildlife Resources.

This report serves as a handbook of inventory and harvest data. It is designed primarily for the use of those concerned with the management of upland game in Utah. A separate section is devoted to each form of upland game hunted in Utah. Data is presented primarily in tabular form with limited narrative comment. The first page of each section provides a brief summary of population status and trend as indicated by inventory and harvest data.

During 1979, a total of 104,834 Utah sportsmen spent 684,654 days afield in pursuit of various upland game species. The harvest of upland game totaled 945,051. The proportion of the total upland game hunters which pursued each species is shown in Appendix Table 3 and the percentage failing to bag at least one bird of each species in Appendix Table 4. The framework for 1979 upland game hunting seasons is shown in Appendix Table 6. Harvest statistics by species were as follows:

Species	Hunters Afield	Total Harvest	Hunter Days	Bag per Hunter-day	Bag/Hunter For Season
Pheasant	87,462	216,700	266,245	0.81	2.48
Mourning dove	34,903	351,161	120,459	2.92	10.06
Chukar partridge	15,210	51,916	42,254	1.23	3.41
Sage grouse	16,927	28,280	30,682	0.92	1.67
Forest grouse	21,993	59,851	57,404	1.04	2.72
Quail	5,632	15,882	13,550	1.17	2.81
Hungarian partridge	3,435	6,200	7,787	0.80	1.80
Wild turkey					
spring	90	1	237	--	--
fall	36	3	71	0.05	0.08
Band-tailed pigeon	62	117	133	.88	1.88
Sharp-tailed grouse	156	76	220	0.35	0.49
Cottontail	33,385	200,223	127,497	1.57	6.00
Snowshoe hare	6,787	14,641	18,115	0.81	2.16
	<u>945,051</u>	<u>684,654</u>			

Total hunters afield for all species of upland game = 104,834

---

A total of 31,103 upland game bird questionnaires were mailed, an approximate 23 percent sample. This year's questionnaire combined the two (upland game bird and rabbit and hare) questionnaires used previously. However, the questionnaires were analyzed separately, employing the same techniques as in past years. A total of 3,487 (11.2%) questionnaires were undeliverable. There were 1,224 returns from persons who did not purchase a license during 1979.

Of the 27,616 questionnaires delivered, 9,274 (33.6%) usable game bird questionnaires were returned. Of those, 2,448 did not hunt game birds leaving a total of 6,826 hunters sampled. This combined with a total of 134,986 eligible licensees to produce a projection factor of 14.555316.

A total of 9,247 usable rabbit and hare questionnaires were returned. Of these, 2,032 did not hunt game rabbits. There were 7,215 hunters who reported hunting cottontails and/or snowshoes. This combined with the 134,986 eligible licensees resulted in a projection factor of 14.597816.

The annual weather summary for 1979, prepared by State Climatologist, E. Arlo Richardson, was not available for analysis this year due to the fact that this report is being published three months earlier than in previous years. However, monthly temperature and precipitation patterns are shown by Figures 1 and 2.

Temperature departure from normal ( $^{\circ}\text{F}$ )

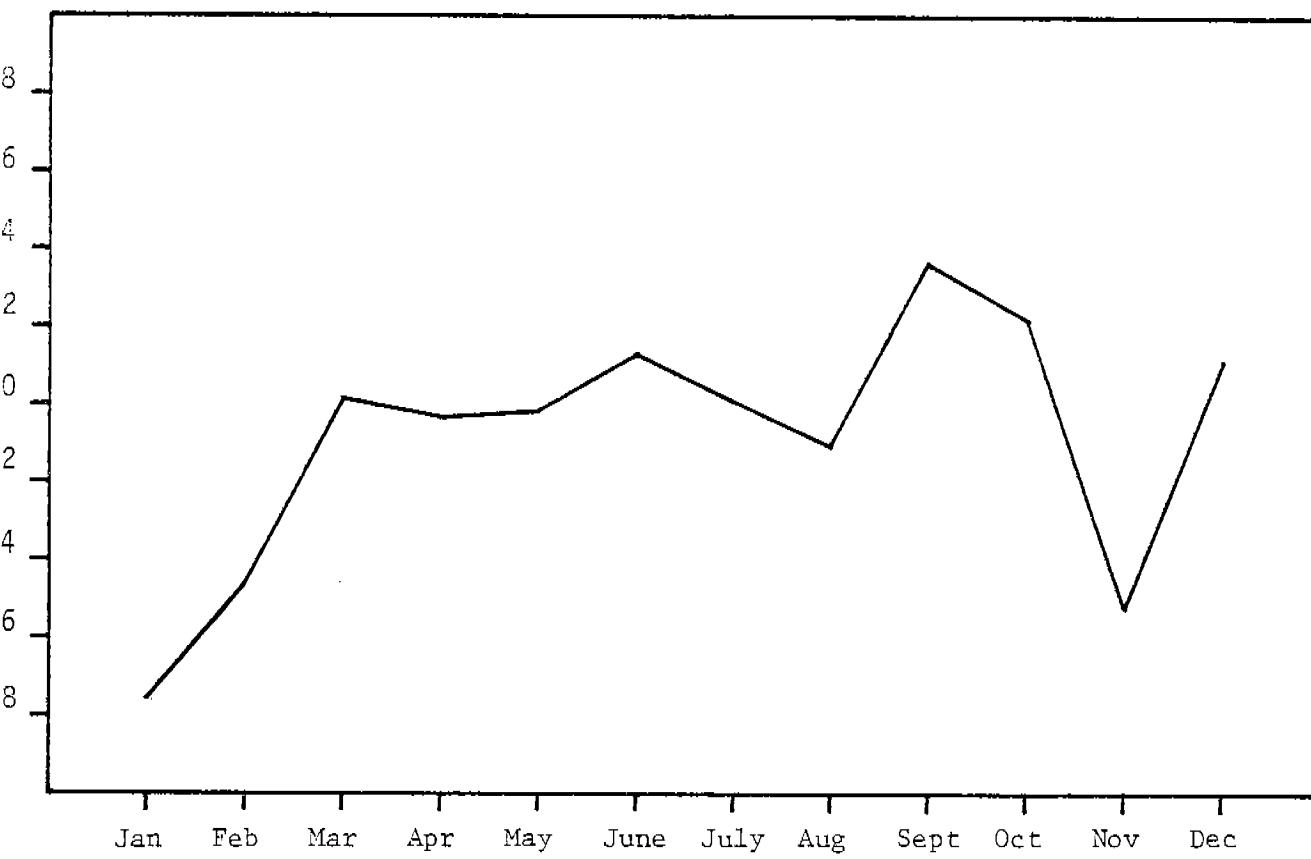

Figure 1. Monthly average temperature departure from normal, 1979.

Precipitation departure from normal (inches)

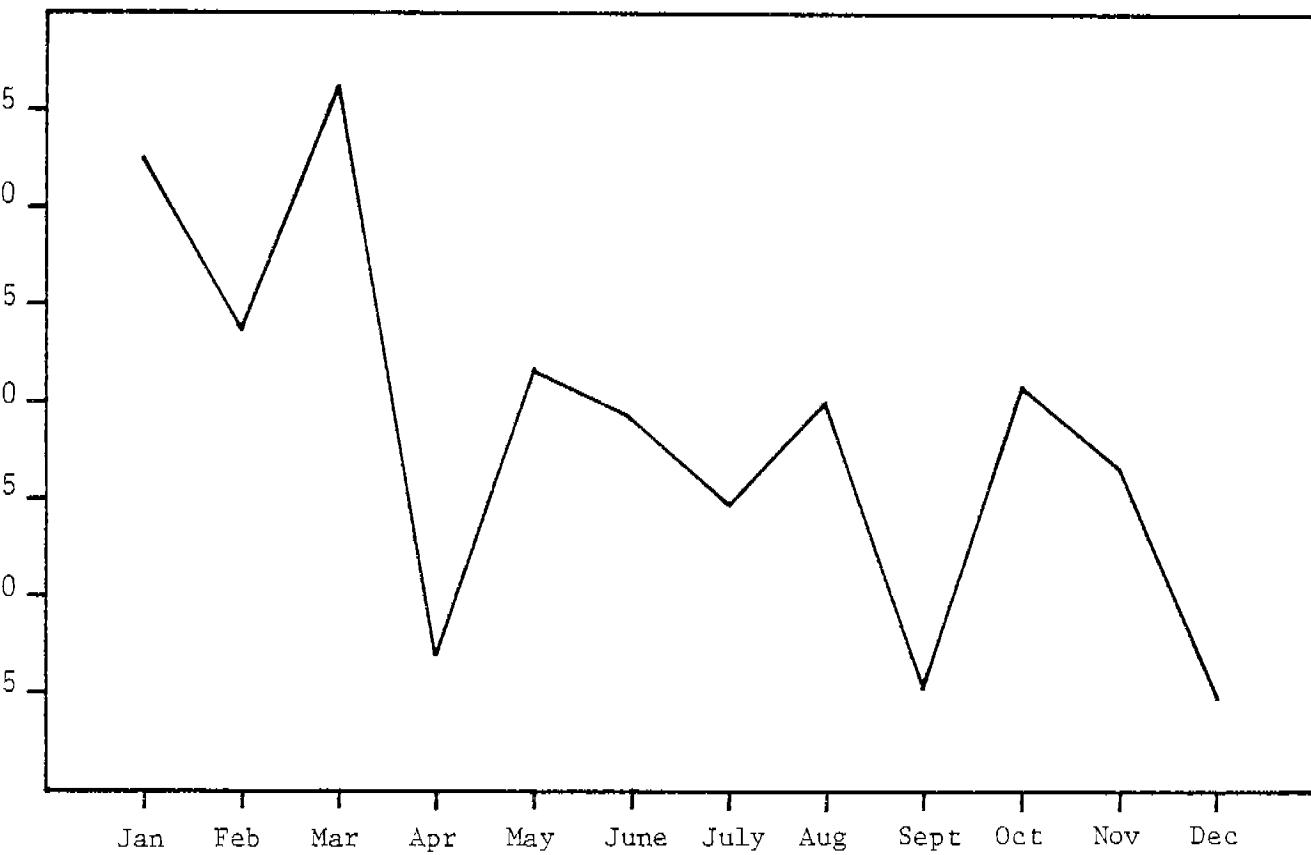

Figure 2. Monthly average precipitation departure from normal, 1979.

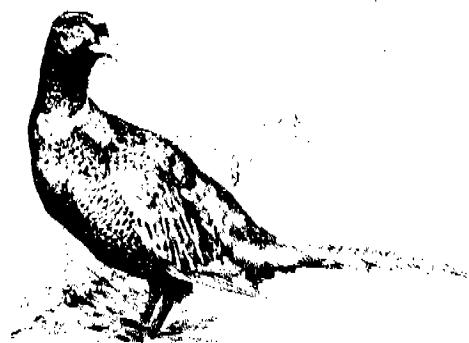

# RING-NECKED PHEASANT

## SUMMARY

The statewide breeding population indexes, based on 1978 harvest data, were above the 1978 level and below average except in the Northeastern Region. However, winter sex-ratio indexes indicated increased breeding populations. Winter carry-over from 1978 appeared good due to the generally mild, open winter.

Weather conditions during the nesting season were generally favorable. Production was generally above 1978 and slightly above average statewide. The combination of good carry-over and higher production than 1978 resulted in excellent fall populations.

Harvest statistics compiled from the questionnaire indicated an excellent hunt. Harvest was second highest since 1972 and was only 2 percent less than 1978. Hunter numbers increased 4 percent over 1978, and likewise, hunter-days afield showed slight increases. However, birds per hunter-day decreased 6 percent from 1978. Field bag check data showed that hunters spent less time afield per hunter-day. The 0.89 birds per hunter index from field bag checks was comparable to the index from hunter questionnaires.

### Winter Sex-ratio Counts

Results of the survey for the winter of 1978-79 and long-term trends are shown in Tables 1 and 2 of this section. Statewide comparisons to the winter of 1977-78 and the average are as follows:

	<u>Winter of 1978-79</u>	<u>Percent change from 1977-78</u>	<u>Average</u>
Total pheasants counted (roadside)	10,584	+118	- 4
Hens per cock	3.3	- 11	-23
Pheasants observed per 100 hours	1,748	+146	+28
Total hours effort (roadside)	605.5	- 11	-24

Winter sex-ratio counts indicated an increased breeding population in 1979 than in 1978 and much below average. Counting conditions were generally good with adequate snow cover. Winter carry-over was good. The hen-cock ratio decreased from 1978 and remained below average.

### Roadside Counts

A summary of summer roadside pheasant counts for 1979 is shown on Table 3. Long-term trends of pheasants per mile, young per mile, young per hen, percent of hens with young and mean brood size are found in Tables 4-8. Summer 1979 survey results compared to 1978 and the average follow:

	<u>1979</u>	<u>Percent change from 1978</u>	<u>Average</u>
Total pheasants observed	3,517	+20	+13
Total miles driven	2,572	-11	-12
Pheasants per mile	1.37	+3 <sup>4</sup>	+11
Average brood size	5.79	+ 2	+ 6
Young per hen	4.05	- 6	+ 1
Percent of hens with young	73	- 4	0

April temperatures were slightly below normal with below normal precipitation. May temperatures and precipitation were slightly below normal. June was warm and dry. Counting conditions were good over most of the state.

Production increased significantly from 1978 and was above 1978 levels in all regions. The density index (pheasants per mile) increased from 1.02 in 1978 to 1.37 in 1979 and was above the average of 1.23 pheasants per mile.

A good carry-over from 1978, coupled with increased production during 1979, resulted in an excellent pheasant population throughout Utah.

## Harvest

### Hunter Questionnaire

Results of the hunter questionnaire for 1979 are shown in Table 9. Long-term trends of pheasants bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 10-12 and total statewide harvest statistics in Table 13. Following is a comparison of 1979 harvest statistics to 1978 and the average:

	<u>1979</u>	<u>Percent change from</u>	
		<u>1978</u>	<u>Average</u>
Pheasant hunters	87,462	+ 4	+ 5
Pheasants harvested	216,700	- 2	- 8
Hunter-days afield	266,245	+ 3	+23
Pheasants per hunter-day	0.81	- 6	-26
Pheasants per hunter	2.48	- 6	-12

Total hunters increased from 1978 to the highest level since 1971--five percent more than the long-term average (1948-78). Hunter-days afield also increased, however, the total harvest decreased 2 percent from 1978. Hunter success (pheasants per hunter-day) decreased from 1978 and remained below average. Pheasants per hunter remained below average by 12 percent.

Long-term trends (1964-79) of total hunters, hunter-days, harvest and hunter success are shown in Figure 1.

### Field Bag Checks

A summary of pheasant field bag check data for 1979 is shown in Table 14. The hunter success trend determined via bag checks since 1974 is found in Table 15. A comparison of 1979 data, on a statewide basis, to 1978 and the average follow:

	<u>1979</u>	<u>Percent change from</u>	
		<u>1978</u>	<u>Average</u>
Total hunters checked	5,262	- 1	+14
Total hours hunted	17,314	- 1	+10
Pheasants per hunter (complete hunts)	0.89	+ 1	+ 1
Pheasants bagged per 100 hours	22	+10	+16
Average hours per hunter-day (complete hunts)	4.1	- 7	-11
Hours hunted per pheasant bagged	4.6	-10	-16

The decrease in total hunters checked most likely reflects decreased efforts to collect data rather than decreased hunter pressure. The 0.89 birds per hunter index was comparable to the index derived from the harvest questionnaire (0.81 birds per hunter-day).

Overall, the field bag check showed decreased hunter effort per day and increased hunter success compared to 1978. The average hunter spent 4.1 hours afield, compared to 4.4 for 1978.

\*Pheasants per hunter index based on all hunts.

# MIGRATORY UPLAND GAME BIRDS

## SUMMARY

### Mourning Doves

The breeding density index increased slightly in 1979 but was well below average.

Harvest statistics derived from the questionnaire showed decreased hunter pressure and harvest compared to 1978. The total harvest was the third highest ever recorded and was 19 percent above the 1969-1978 average. Hunter success decreased slightly.

Field bag checks indicated a slight increase in hunter success contrary to the questionnaire survey. The 1979 hunt was very good and comparable to the 1978 hunt.

Considerably more wings were collected for aging during 1979 than in 1978 and 1977. The juvenile per 100 adult ratio was relatively low, 91 compared to 75 in 1978, and a nine-year average of 124.

### Band-tailed Pigeons

Banding of band-tailed pigeons was discontinued in 1979, as a result of recommendations by the Four-Corners Band-tailed Pigeon Study Committee, to limit banding to specific research projects.

Hunter participation during the 1979 season remained at a low level with only 62 hunters afield. Total hunter-days and harvest decreased from 1978 and the average. Total harvest was 117 pigeons, compared to 264 in 1978.

## MOURNING DOVE

### Call-Count Survey

Results of the 1979 call-count survey are found in Table 1 of this section. The long-term trend of the state's breeding density index (average doves heard per route) is shown in Table 2. Indexes shown in each of these tables are unweighted and consequently differ from those published in the annual Mourning Dove Status Report compiled by the Fish and Wildlife Service; however, indicated trends are similar (Figure 1). The following is a comparison of the results of the 1979 survey to 1978 and the average for the period 1964-78:

	<u>1979</u>	<u>Percent change from</u>	
		<u>1978</u>	<u>Average</u>
Total doves heard per route	7.1	+ 3	-51
Total calls heard per route	28.1	+10	-54
Total doves seen per route	5.8	-25	-62

Coo count data indicated increased breeding activity in late May compared to 1978, but continued to be well below average.

### Harvest

#### Hunter Questionnaire

Information obtained from the hunter questionnaire for 1979 is summarized in Table 3. Long-term trends of mourning doves bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 4-6 and total statewide harvest statistics in Table 7. The following is a comparison of the harvest statistics for 1979 compared to 1978 and the 10-year (1969-78) average:

	<u>1979</u>	<u>Percent change from</u>	
		<u>1978</u>	<u>Average</u>
Mourning dove hunters	34,903	-3	+16
Mourning dove harvest	351,161	-8	+19
Hunter-days afield	120,459	-7	+20
Mourning doves per hunter-day	2.92	-1	- 1
Mourning doves per hunter	10.06	-6	+ 3

Hunting pressure and harvest decreased from 1978. Hunter success also decreased slightly. The harvest was third highest on record.

Long-term harvest trends are depicted in Figure 2.

### Field Bag Checks

A summary of field bag check data for 1979 is shown in Table 8. Hunter success trends determined via this method are shown in Table 9. Results of the 1979 survey compared to 1978 and the average (1967-78) follow:

		Percent change from	
	<u>1979</u>	<u>1978</u>	<u>Average</u>
Total hunters checked	4,422	+48	+203
Total hours hunted	16,800	+78	+263
Doves per hunter (complete hunts)	2.86	+ 8	- 19
Doves bagged per 100 hours	69	-16	- 29
Average hours per hunter-day (complete hunts)	4.1	+28	+ 17
Hours hunted per dove bagged	1.4	+ 8	+ 27

Field bag checks indicated an 8 percent increase in hunter success. However, the questionnaire results indicated a slight decrease in hunter success. The total number of hunters checked was up 48 percent as a result of increased effort. Dove hunters spent a greater amount of time afield per hunter-day than in 1978 and more time was spent per dove bagged, according to field bag check data.

### Age Composition of the Harvest

A summary of the age composition of harvested mourning doves from 1970 through 1979 is contained in Table 10. Hatching dates for immature doves harvested in the Northern Region are shown in Table 11.

Following is a comparison of data collected in 1979 to 1978 and long-term averages:

		Percent change from	
	<u>1979</u>	<u>1978</u>	<u>Average</u>
Sample size	5,330	+ 3	+96
Immatures/100 adults	91	+21	-27
Percent of immatures hatched on:			
August 3 or later	45.6	-14	+18
July 25 or later	82.6	- 8	+ 4
Before July 25	17.4	+78	-14

More wings were collected for aging during the 1979 season compared to 1978 and 1977. The 91 immatures per 100 adults ratio was the second lowest recorded and indicated an early hatch and subsequent early migration of newly hatched young. Wing analysis substantiated earlier hatching for 1979 compared with 1978.

### Banding

A banding moratorium was declared for the Western Management Unit beginning in 1976 to facilitate a complete analysis of past accumulated banding data.

A summary of banding accomplished by county and region through 1975 is contained in Table 12, a summary of statewide recovery rates through 1975 in Table 13 and a summary of recovery and return locations through 1975 in Table 14.

A summary of doves recovered in Utah that were banded in other states through 1975 is found in Table 15.

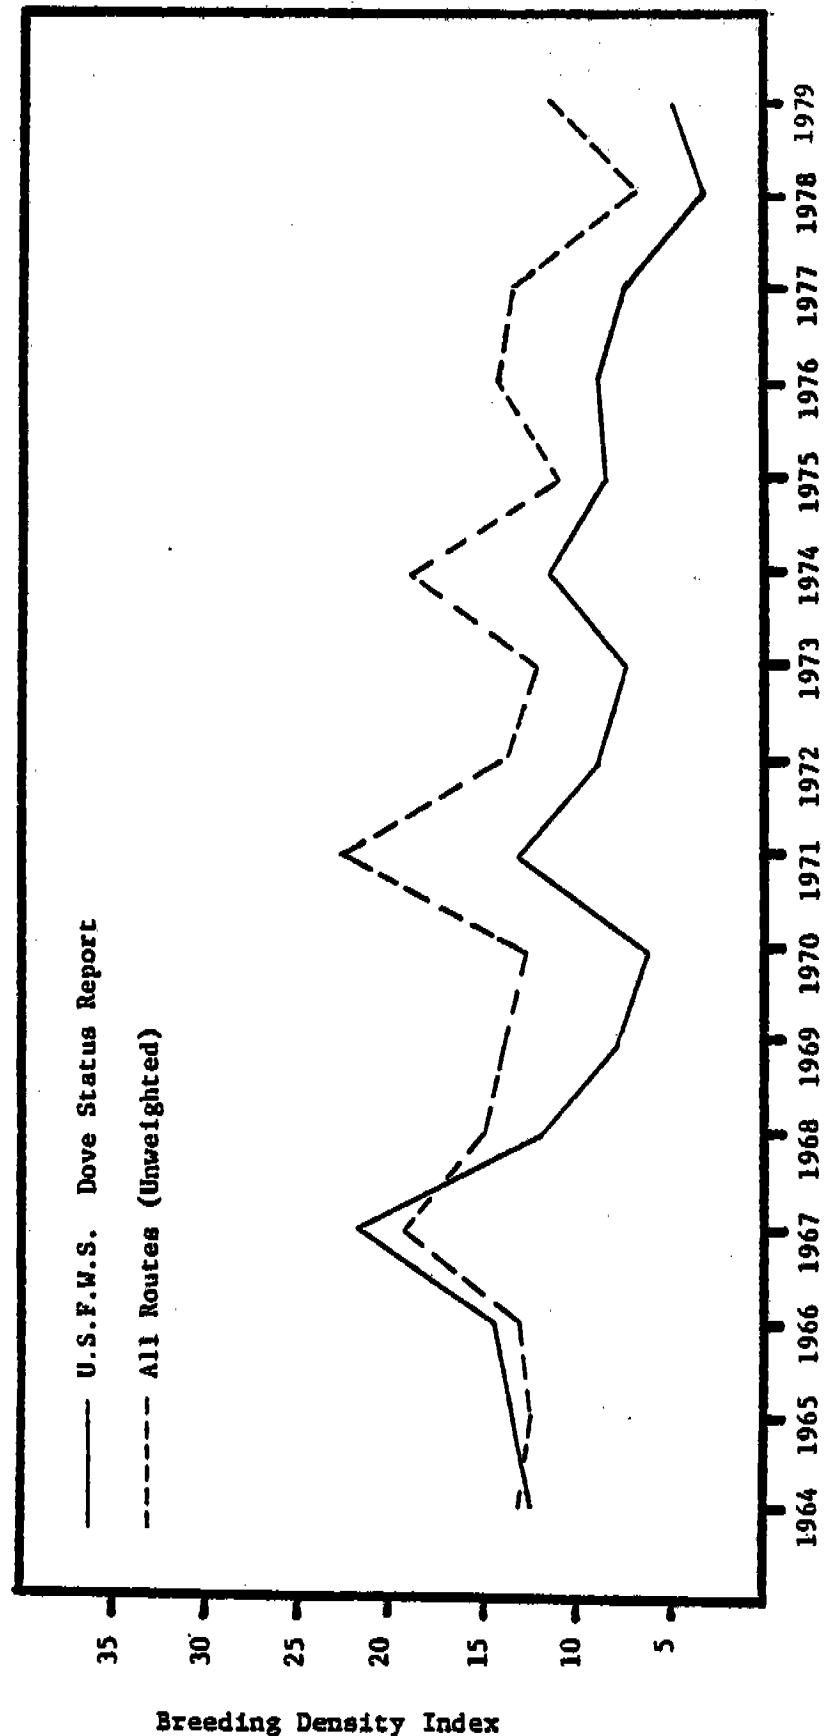

Figure 1. Mourning dove breeding density index trend, 1964-79

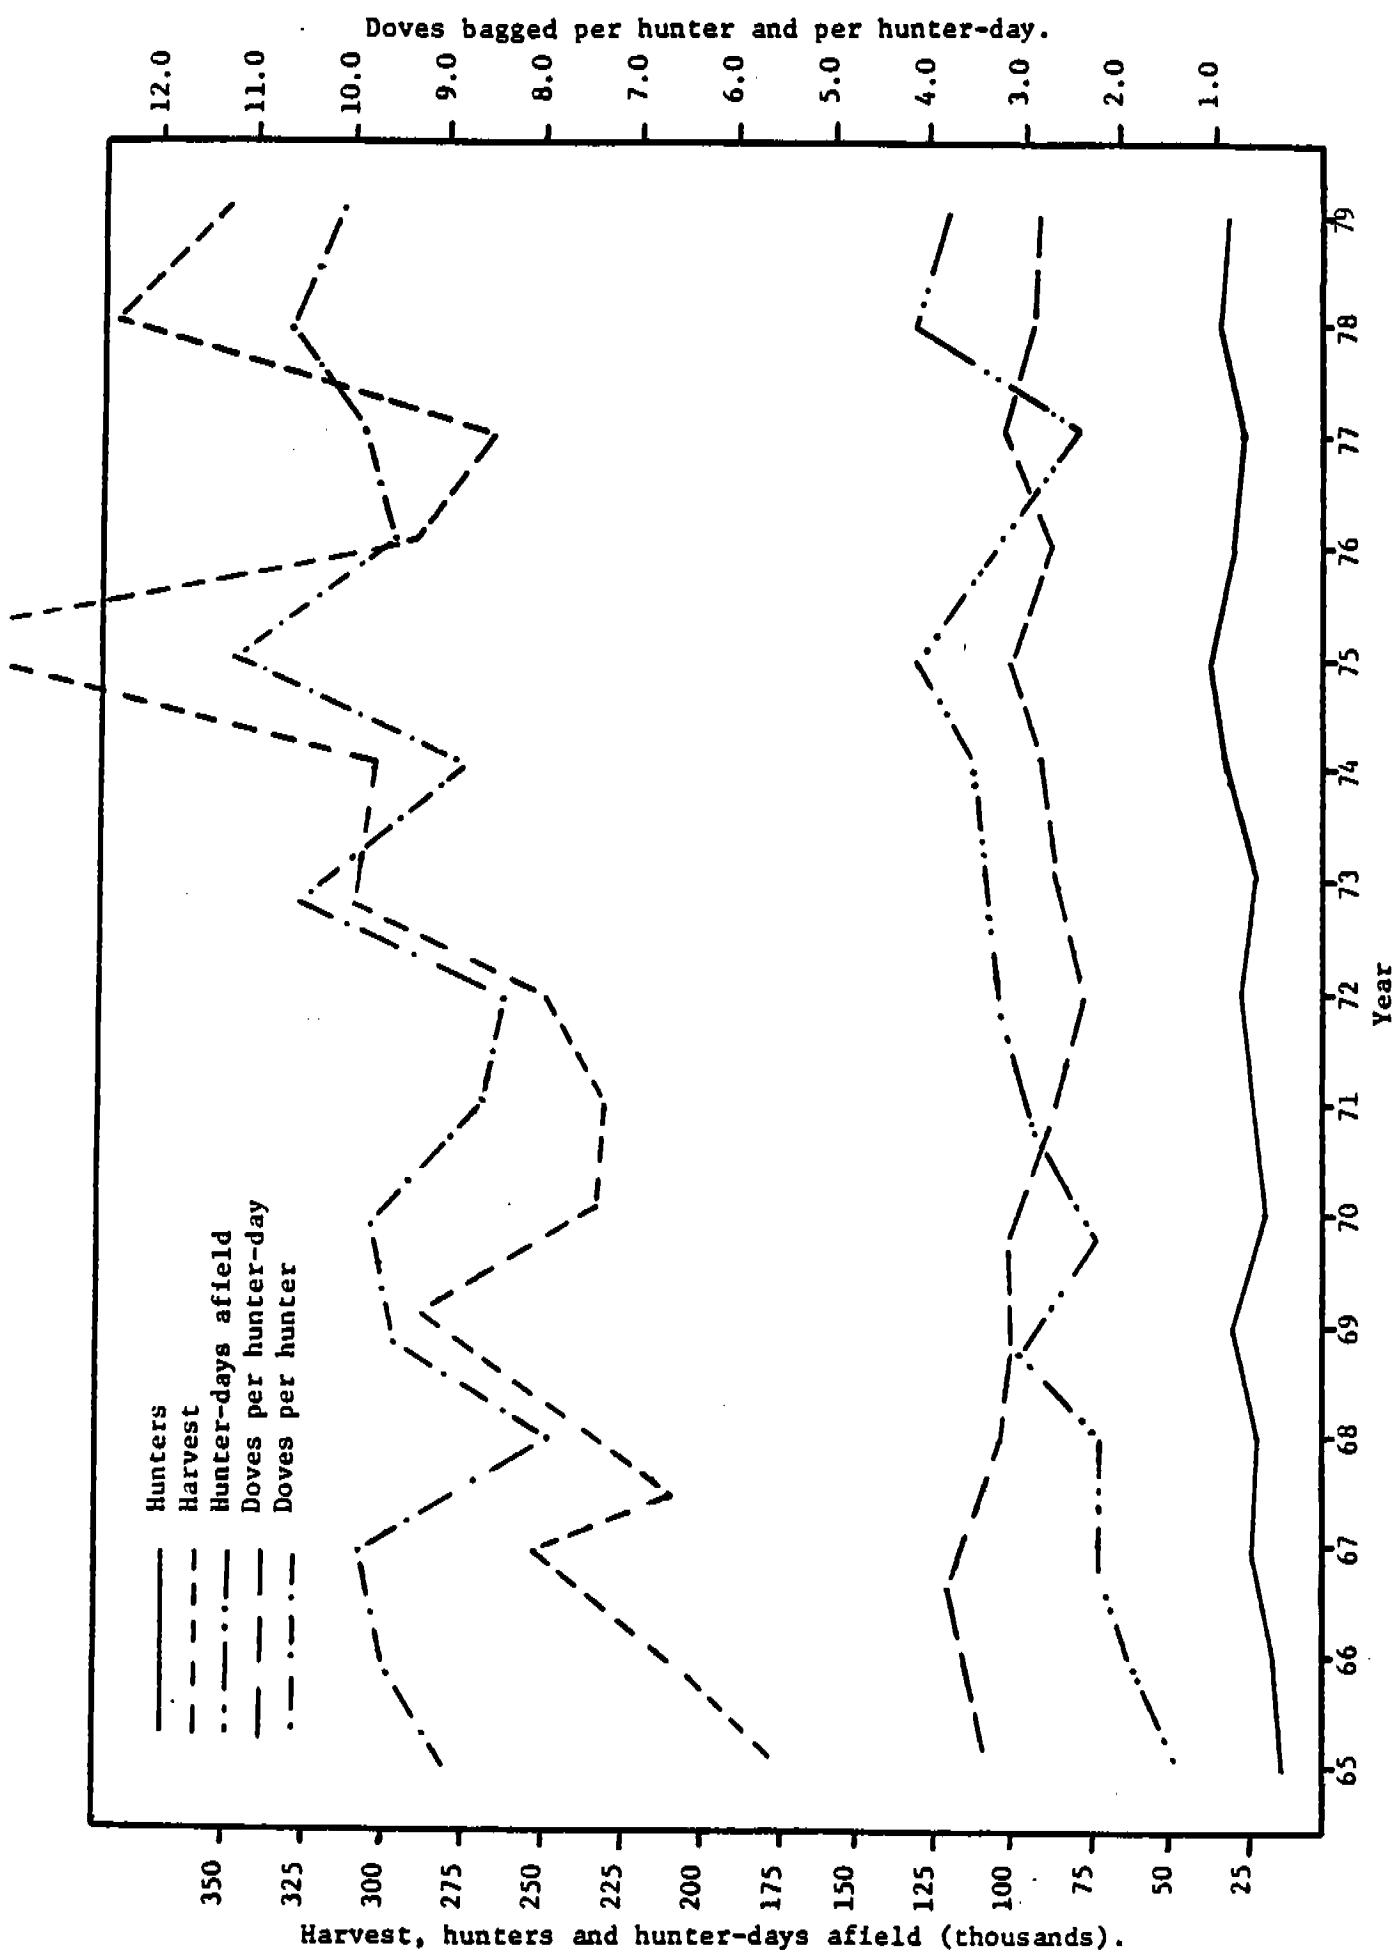

Figure 2. Statewide trends of mourning dove harvest statistics.

Table 1. Summary of the mourning dove call-count survey for 1979.

\*Direct recovery - A banded dove that is killed during the first hunting season following banding.

\*\*Total recovery - Direct recoveries plus all subsequent recoveries for any given cohort of banded doves.

\*\*\*Data reported for 1967-1973 differs from previous reports. Data reported here includes all bands returned through December 1977, but excludes some bands previously reported because the bands did not conform to all Fish and Wildlife Service criteria for proper analysis. Problems causing rejection of data include banding before or after banding season, failure to read age class, etc. Band returns from reported bandings were not recorded.

Table 14. Summary of combined recoveries (returns and retraps) of mourning doves banded in Utah, 1967-75.

## BAND-TAILED PIGEON

### Banding

Banding efforts were discontinued in 1979 as a result of recommendations of the Four-Corners Band-tailed Pigeon Study Committee. The Committee concluded that, from 1979, banding should be limited to specific research needs.

During 1979, no pigeons were banded in Utah. Since 1969, 2,649 total pigeons have been banded in Utah and 975 recaptured. Results of banding efforts through 1972 indicated a direct recovery rate of 1.4 percent. If expanded, using an assumed 30 percent band reporting rate, an estimated harvest rate of less than 5 percent of the state's pigeon population is indicated. Addition of an estimated 16 percent crippling loss would result in a total kill rate of from 5-10 percent, well within the harvestable surplus.

### Harvest

Results of the 1979 harvest questionnaire are shown in Table 18 and harvest trends since 1970 in Table 19. A comparison of the 1979 season to 1978 and the average follows:

	<u>1979</u>	<u>1978</u>	<u>Percent change from Average</u>
Band-tailed pigeon hunters	62	-21	+11
Band-tailed pigeon harvest	117	-56	-31
Hunter-days afield	133	-44	- 1
Pigeons per hunter-day	0.9	-18	-25
Pigeons per hunter	1.9	-44	-32

Total hunters decreased slightly from 1978 and hunter-days afield also decreased 44 percent. Total harvest also decreased dramatically from 1978. Most of the 1979 harvest occurred in Grand and San Juan counties.

# CHUKAR PARTRIDGE

C  
H  
U  
K  
A  
R  
S

## SUMMARY

The statewide breeding population of chukars was significantly increased in 1979 following the excellent production during 1978. Overwinter survival was near normal. Late winter and early spring precipitation, critical to successful chukar production, was again above average, indicating good reproductive potential.

Results of the brood survey confirmed the good reproduction expected due to the abundance of spring moisture and resulting excellent forage conditions during breeding and nesting. The indicated chukar density increased more than 80 percent from 1978. Chukars observed per 100 hours of effort increased from 96 in 1977, to 213 in 1978, to 396 in 1979--a 312 percent increase. Broods located were larger than the long-term average.

Harvest statistics reflected the high chukar density with harvest success (chukars/hunter-day) remaining well above average and comparable to 1978, but hunter pressure decreased significantly resulting in a lower overall harvest.

### Brood Counts

Results of the annual random brood survey for 1979 are shown in Table 1 of this section. Long-term trends of young-adult ratios, mean brood size and chukars observed per 100 hours are found in Table 2-4. Following are the survey results for 1979 compared to 1978 and the average:

	<u>1979</u>	<u>Percent change from</u>	
		<u>1978</u>	<u>Average</u>
Total chukars observed	729	+147	-40
Young per 100 adults	245	- 45	-34
Mean brood size	10.35	+ 18	+20
Chukars observed per 100 hours	396	+ 86	+14
Total hours effort	199	+ 25	-43

Harvest data for 1978 indicated increased breeding populations for 1979 in all regions. Late winter and early spring precipitation (Dec.-April) was above average over the entire state (Fig. 2) producing favorable conditions for good production.

Effort on chukar brood counts increased from 1978 but remained far below average.

Brood count sample sizes were extremely small for all regions. The Central Region counted 21 of the state total of 34 broods. Chukar density increased to 14 percent above average as a result of high carry-over from 1978 and good production during 1979.

### Harvest

#### Hunter Questionnaire

Results of the hunter questionnaire survey for 1979 are shown in Table 5. Long-term trends of chukars bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 6-8 and total statewide harvest statistics in Table 9. Following is a comparison of 1979 harvest statistics to 1978 and the average:

	<u>1979</u>	<u>Percent change from</u>	
		<u>1978</u>	<u>Average</u>
Chukar hunters	15,210	- 6	- 3
Chukars harvested	51,918	-21	+18
Hunter-days afield	42,254	-22	- 8
Chukars per hunter-day	1.23	+ 2	+28
Chukars per hunter	3.41	-16	+21

Chukars harvested, chukar hunters, hunter-days afield and chukars per hunter all decreased from 1978. However, harvest (total birds, chukars per hunter and per hunter-day) remained above average while pressure (total hunters and days afield) dropped somewhat below average.

#### Field Bag Check

A summary of field bag check data for 1979 is shown in Table 10. The hunter success trend determined by field bag checks since 1974 is shown in Table 11. Data for the 1979 season compared to 1978 and the average follow:

	<u>1979</u>	<u>Percent change from</u>	
		<u>1978</u>	<u>Average</u>
Total hunters checked	300	+25	-50
Total hours hunted	996	+ 1	-64
Chukars per hunter (complete hunts)	1.07	-33	- 5
Chukars bagged per 100 hours	29	-19	+26
Average hours per hunter-day (complete hunts)	3.7	-18	-21
Hours hunted per chukar bagged	3.5	+25	-30

Field bag checks reflected the somewhat decreased success shown by the questionnaire. Chukars per hunter decreased by 33 percent from 1978 but was only 5 percent below average.

The daily hunter success rate (birds/hunter) shown by field bag checks was about 15 percent below the rate shown by the questionnaire. Field bag checks were almost entirely confined to the opening weekend while the questionnaires reflect season-long success. Many hunters reported difficulty locating chukars during the late fall period when temperatures were above average. Chukars apparently moved to high inaccessible areas during a heavy snow storm in late October and remained there through the rest of the season, despite the moderation in the weather.

The average hours hunted per day increased somewhat from 1978 and the amount of time spent to bag each chukar decreased dramatically.

Chukars bagged per hunter and per hunter-day.

# SAGE GROUSE

## SUMMARY

Harvest data for 1978 indicated a good breeding population of sage grouse for 1979. Strutting ground surveys were hampered by poor access over much of the state.

Brood surveys showed significantly increased populations throughout the state during 1979. Birds observed per 100 hours increased 53 percent compared to 1978 and was 70 percent above average.

The good population of 1979 was apparent in harvest statistics collected from questionnaires and from field bag checks. Total statewide harvest increased by 9 percent and established a record high harvest for sage grouse. Total hunters and hunter-days afield both increased to record levels. Sage grouse bagged per hunter and per 100 hours effort likewise showed an increase over 1978.

### Strutting Ground Counts

The status of the sage grouse breeding population for 1979 as indicated by strutting ground counts is shown in Table 1 of this section. Results of this survey for 1979 compared to 1978 and the 1969-78 average follow:

	<u>1979</u>	<u>1978</u>	<u>Percent change from Average</u>
Number of grounds counted	120	-13	+ 3
Total grouse counted	2,808	0	+15
Average male grouse per ground	23.4	+15	+ 9
Percent change from previous year (comparable grounds)	-13	--	--

Access for spring 1979, strutting ground counts was extremely poor in the central, southern and eastern areas of the state. Counts were down 39 percent in the Central Region, 22 percent in the Southern Region and 25 percent in the Northeastern Region. The statewide index for comparable grounds was down 13 percent. Harvest data for 1978 indicated increased and above average populations going into the 1978-79 winter. Much of the decrease in grouse population, indicated by strutting ground counts, resulted from poor access rather than actual decreases in grouse populations.

### Brood Counts

Results of the survey for 1979 are found in Table 2. Long-term trends of young-adult ratios, mean brood size and sage grouse observed per 100 hours are shown in Tables 3-5. Indexes for 1979 are compared to 1978 and the previous 10 year average as follows:

	<u>1979</u>	<u>1978</u>	<u>Percent change from Average</u>
Total sage grouse counted	4,024	+13	+21
Young per 100 adults	175	- 3	+22
Mean brood size	4.77	- 4	+ 6
Sage grouse observed per 100 hours	624	+53	+71
Total hours effort	645	-26	+29

The effort devoted to sage grouse brood counts was down significantly compared to 1978 and well below average. However, the total number of grouse counted was 13 percent above 1978 and 21 percent above average.

Very good production, even better than during 1978, was apparent throughout the state during 1979. Sage grouse density increased from 1978 and sage grouse numbers were high statewide.

## Harvest

### Hunter Questionnaire

Results of the 1979 hunter questionnaire are shown in Table 6. Long-term trends of sage grouse bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 7-9 and total statewide harvest statistics in Table 10. The results of the 1979 hunting season compared to 1978 and the 1963-78 average follow:

	<u>1979</u>	<u>Percent change from</u>	<u>1978</u>	<u>Average</u>
Sage grouse hunters	16,927	+ 4	+60	
Sage grouse harvested	28,280	+ 9	+92	
Hunter-days afield	30,682	+ 3	+71	
Sage grouse per hunter-day	0.92	+ 5	+12	
Sage grouse per hunter	1.67	+ 4	+20	

The very good production of 1979 was quite apparent in the harvest. Total statewide harvest increased by 9 percent and set a new record for sage grouse harvested in Utah. Total sage grouse hunters and hunter-days afield both increased to record numbers, reflecting the increasing interest in sage grouse hunting. Hunter success increased in every region except the Southeastern Region.

Long-term sage grouse harvest trends are shown in Figure 1.

### Field Bag Checks

A summary of field big check data for 1979 is shown in Table 11. Hunter success trends determined via this method are shown in Table 12. Results of the 1979 survey compared to 1978 and the 1969-78 average follow:

	<u>1979</u>	<u>Percent change from</u>	<u>1978</u>	<u>Average</u>
Total hunters checked	2,290	- 2	- 9	
Total hours hunted	7,885	-19	-22	
Sage grouse per hunter (complete hunts)	1.01	+ 3	+28	
Sage grouse bagged per 100 hours	27	+17	+50	
Average hours per hunter-day (complete hunts)	3.7	-12	-35	
Hours hunted per grouse bagged	3.7	-15	-36	

Field bag checks substantiated the harvest questionnaire data on hunter success. Sage grouse bagged per hunter increased and remained high and grouse bagged per 100 hours effort increased by 17 percent to 50 percent above average. The average hunter spent less time afield than in 1978, but was more successful because of the increased populations of sage grouse.

### Sex and Age Composition of the Harvest

A summary of the sex and age composition of harvested sage grouse in 1979 is found in Table 13 and the trend from 1976-79 in Table 14.

Following is data derived from wing surveys in 1979, compared to 1978 and the 1973-78 averages:

	<u>1979</u>	<u>Percent change from</u>	
		<u>1978</u>	<u>Average</u>
Sample size	1,956	+ 9	+60
Percent males	42	- 4	0
Percent females	58	+ 4	0
Young per 100 adults	125	-32	-18
Young per 100 hens (adult)	196	-33	-18

Analysis of wings collected at checking stations during the 1979 season would seem to indicate that production was down compared to 1978. However, one must keep in mind that 1978 was an exceptional production year and, as a result, the 1979 spring population consisted of a very high percentage of yearlings. Yearling hens are less successful nesters than adults. Yearlings cannot be separated from adults in the wing samples. Therefore, a high percentage of yearlings in the population tends to deflate young/adult hen ratios.

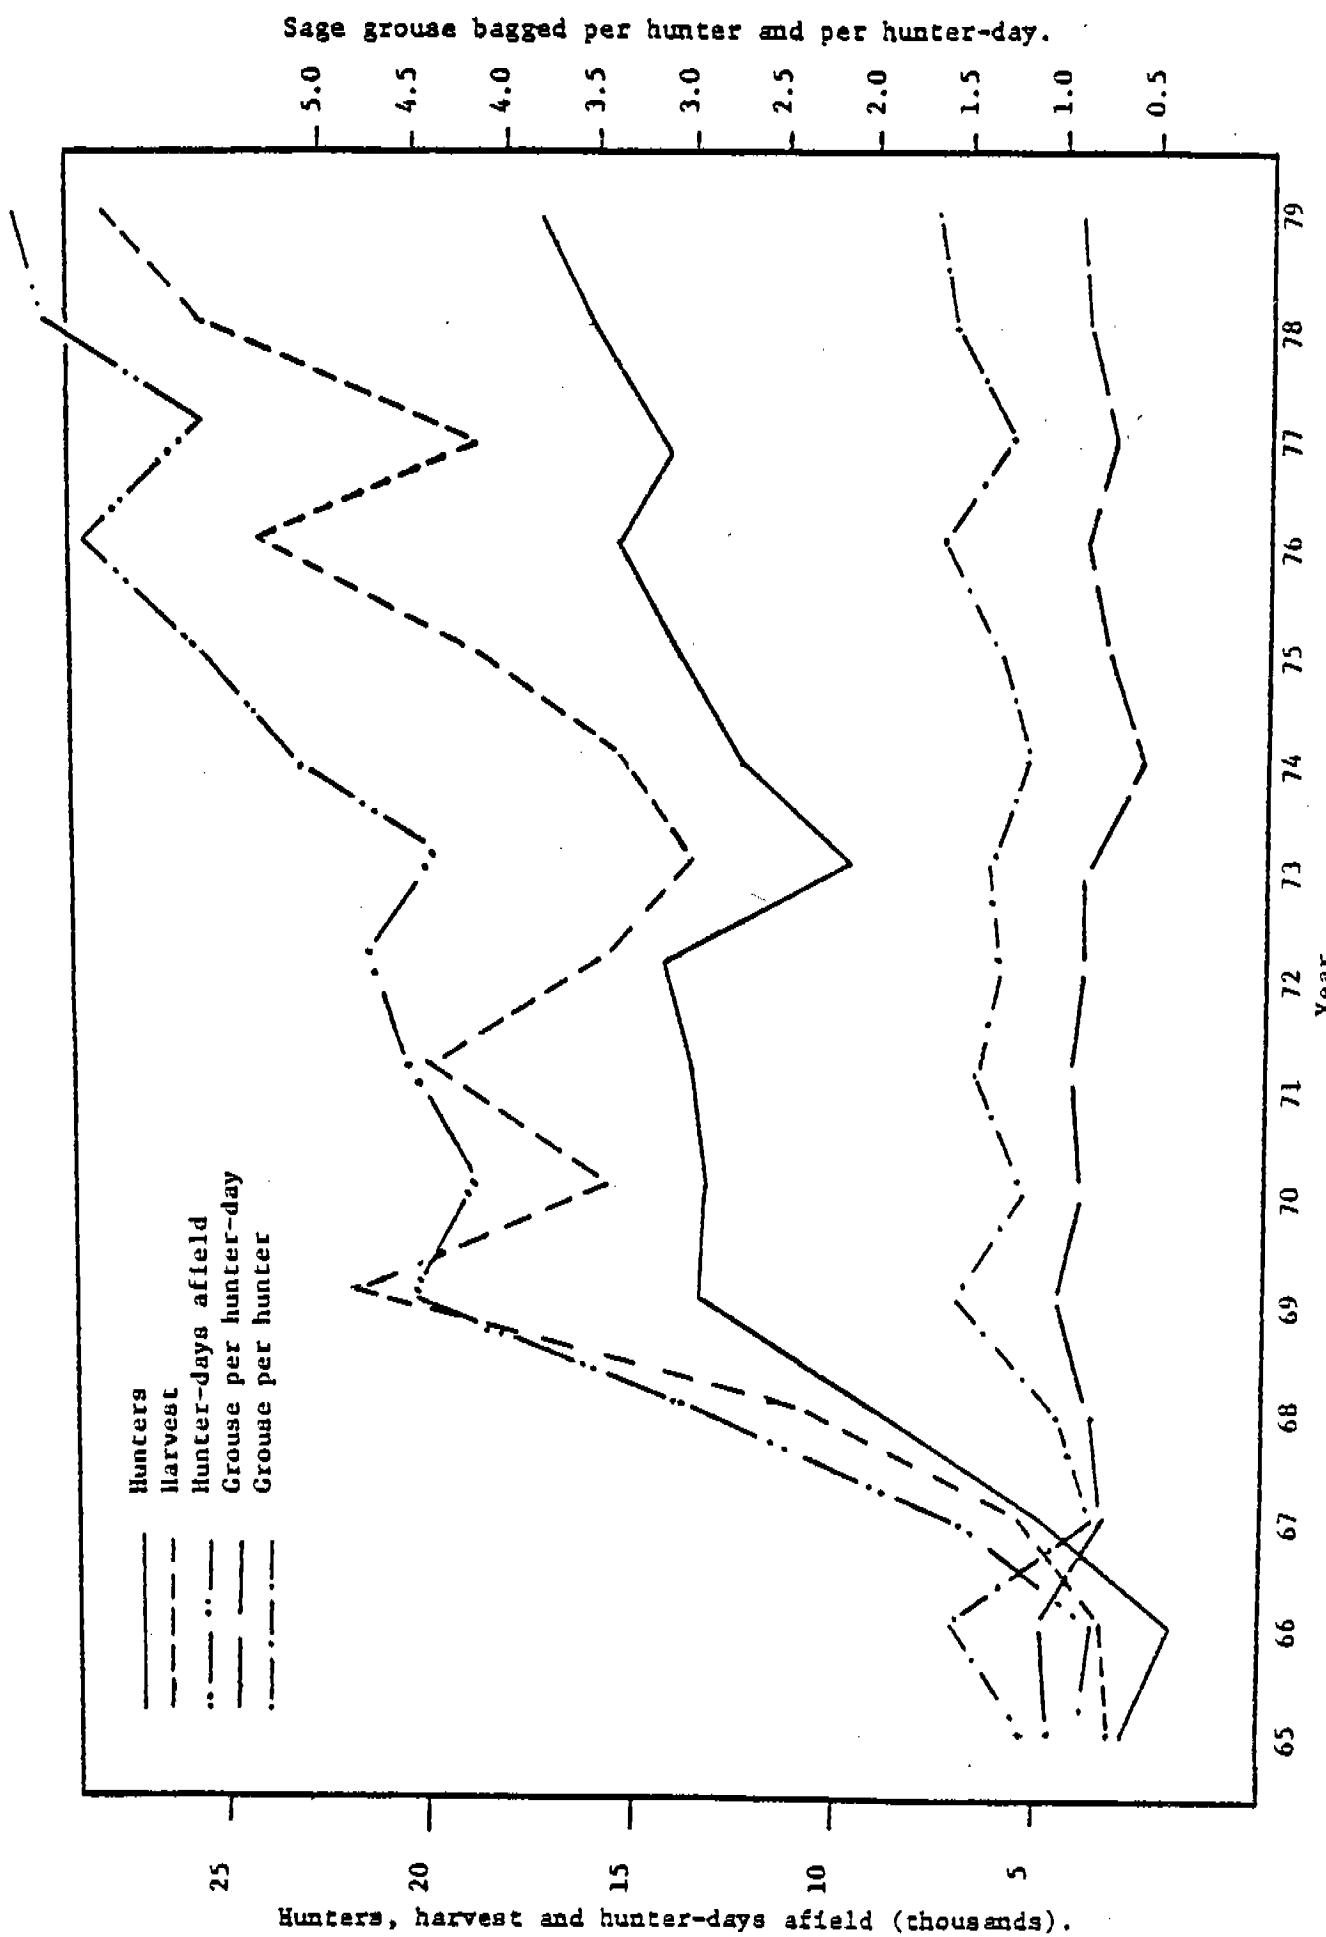

Figure 1. Statewide trend of sage grouse harvest statistics.

\* Includes estimated percentage of juveniles.

\*\* Young per 100 hens (adult females) and young per 100 adults.

n = Wing sample size.

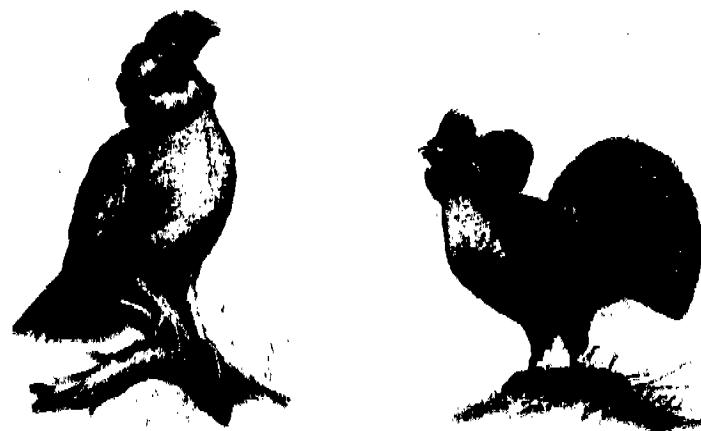

# **FOREST GROUSE**

## **SUMMARY**

Judging from harvest statistics for the fall of 1978, the 1979 breeding populations of both ruffed and blue grouse were up from 1978. Production of ruffed grouse indicated by brood counts was up from 1978 and above average. Blue grouse production was well below average during 1978. The number of ruffed grouse observed during brood surveys and the apparent density (grouse per 100 hours) suggested an increased abundance in 1979 compared to 1978. Blue grouse density and reproductive success were both lower for 1979 than during 1978 and were below average. A total of 147 forest grouse broods were observed during 1979 compared to 125 during 1978.

Harvest statistics indicated lower density of forest grouse. Total harvest decreased from 81,588 during 1978 to 59,851 in 1979, a near 28 percent decrease in harvest. Total hunters decreased from 25,318 in 1978 to 21,993 in 1979, and days afield decreased from 72,732 to 57,404.

Field bag check data confirmed the decreased success shown by the questionnaire. Hunters spent an average of six hours afield for each forest grouse bagged during 1979.

### Brood Counts

#### Ruffed Grouse

Results of the annual random brood survey for 1979 are shown in Table 1 of this section. Long-term trends of young-adult ratios, mean brood size and ruffed grouse observed per 100 hours are found in Tables 2-4. A summary of effort expended on ruffed and blue grouse brood counts combined is shown in Table 9. Survey results for 1979 compared to 1978 and the average follow:

		Percent change from	
	<u>1979</u>	<u>1978</u>	<u>Average</u>
Total ruffed grouse observed	319	+79	+19
Young per 100 adults	398	+15	+34
Mean brood size	5.06	+13	+15
Ruffed grouse observed per 100 hours	37	+28	+12
Total hours effort (forest grouse)	945	+ 4	+14

Harvest statistics for 1978 indicated a decreased breeding population for 1979.

Effort on brood surveys increased in comparison to 1978 to above average.

Total ruffed grouse observed increased from 1978 and was well above average. The density index (grouse observed per 100 hours) was above 1978 and above average.

Mean brood size, based on a sample of 50 broods (compared to 26 broods observed in 1978), increased to over 5 chicks per brood, 15 percent above the long-term average.

#### Blue Grouse

Results of the annual random brood survey for 1979 are shown in Table 5 of this section. Long-term trends of young-adult ratios, mean brood size and blue grouse observed per 100 hours are found in Table 6-8. Survey results for 1979 compared to 1978 and the average follow:

		Percent change from	
	<u>1979</u>	<u>1978</u>	<u>Average</u>
Total blue grouse observed	642	0	+ 9
Young per 100 adults	188	-32	-20
Mean brood size	3.69	-17	-17
Blue grouse observed per 100 hours	68	-36	- 9
Total hours effort (forest grouse)	945	+ 4	+14

Harvest statistics for 1978 indicated an increased breeding population for 1979.

All indications from the 1979 summer surveys on blue grouse were that production was below 1978 and below average. Total observations remained constant because of increased efforts. Data indicate a below average production year. The young per 100 adult ratio and the number of grouse observed per 100 hours effort both increased by 54 and 104 percent, respectively.

Casual observations from the field and the summer inventory both indicated a decreased fall blue grouse population. Wing samples collected at checking stations confirmed the lower production.

### Harvest

#### Hunter Questionnaire

Results of the 1979 forest grouse (ruffed and blue grouse combined) hunter questionnaire are shown in Table 10. Long-term trends of forest grouse bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 11-13 and total statewide harvest statistics in Table 14. Harvest statistics for 1979 compared to 1978 and the average follow:

	1979	<u>Percent change from</u>	
	1979	1978	<u>Average</u>
Forest grouse hunters	21,993	-13	+53
Forest grouse harvested	59,851	-26	+70
Hunter-days afield	57,404	-21	+70
Forest grouse per hunter-day	1.04	- 7	0
Forest grouse per hunter	2.61	-19	+13
Percent ruffed grouse	38.7	+ 4	- 3
Percent blue grouse	55.3	- 3	+ 4
Percent unidentified	6.0	+ 7	-14

Results from the harvest questionnaire confirmed the lower forest grouse population level indicated by summer surveys. It is not surprising that harvest was lower than the record harvest of 1978. Hunter success (grouse per hunter-day) was very near average as was the number of grouse harvested per hunter. Hunter pressure decreased significantly.

#### Field Bag Checks

A summary of field bag check data for 1979 is found in Table 15. Hunter success trends determined via this method are shown in Table 16. Results of the 1979 survey compared to 1978 and the average are as follows:

	1979	<u>Percent change from</u>	
	1979	1978	<u>Average</u>
Total hunters checked	2,065	+13	+42
Total hours hunted	7,730	+55	+36
Forest grouse per hunter (complete hunts)	0.64	0	- 6
Forest grouse bagged per 100 hours	17	-23	- 7
Average hours per hunter-day (complete hunts)	3.8	+35	- 7
Hours hunted per grouse bagged	6.0	+33	- 6

Field bag checks indicated that hunters spent considerably more time afield to harvest their birds. It appears that poor early season success discouraged hunters and resulted in less total pressure.

# **QUAIL**

## **SUMMARY**

The 1979 breeding populations of California and Gambel quail were higher than during 1978 and above average.

Production of both Gambel and California quail increased from 1978 to above average. Population densities were above average in most areas of the state.

Harvest statistics were very similar to 1978. Total hunters and total harvest were slightly below average, but harvest and success increased slightly over 1978 for both species of quail.

### Brood Count

Results of the annual random brood survey for 1979 are shown in Table 1 of this section. Long-term trends of young-adult ratios, mean brood size and quail observed per 100 hours are shown in Tables 2-4. Survey results for 1979 compared to 1978 and the previous 10-year average follow:

	<u>1979</u>	<u>Percent change from 1978</u>	<u>Percent change from Average</u>
Total quail observed	1,151	+ 53	+23
Young per 100 adults	285	+ 4	+28
Mean brood size	8.08	+ 7	+16
Quail observed per 100 hours	1,193	+125	+87
Total hours effort	96.5	- 32	-25

Harvest statistics for 1978 indicated increased breeding populations of California quail statewide and of Gambel quail in Washington County.

Gambel quail call counts on the west slope of Beaver Dam Mountains showed a significant increase compared to recent years.

Production and densities of both California and Gambel's quail increased from 1978 and were well above average.

### Harvest

Results of the annual hunter questionnaire for 1979 are shown in Table 5. Long-term trends of quail bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 6-8 and total statewide harvest statistics in Table 9.

Comparison of the 1979 season to 1978 and the previous 10-year average follow:

	<u>1979</u>	<u>Percent change from 1978</u>	<u>Percent change from Average</u>
Quail hunters	5,632	- 5	-13
Quail harvested	15,821	+ 2	- 4
Hunter-days afield	13,550	- 1	-19
Quail per hunter-day	1.17	+ 4	+18
Quail per hunter	2.81	+ 8	+10

Harvest statistics for 1979 were very similar to 1978 and average.

Hunter success for Washington County (Gambel quail) declined some from 1978, but total harvest increased. About 25 percent of the statewide harvest of quail was taken in Washington County during 1979 compared to 18 percent in 1978 and nearly 25 percent in 1977.

Long-term quail harvest statistics are shown in Figure 1.

Gambel Quail Studies

Annual call-count surveys and long-period waterhole counts have been conducted on the west slopes of the Beaver Dam Mountains since 1962.

Call counts showed significant increases over 1978 and were far above average.

Waterhole counts totaled 330 birds during 1979 compared to 86 during 1978 and 17 during 1977.

Vegetative studies were discontinued in 1977.

# **HUNGARIAN PARTRIDGE**

## **SUMMARY**

Harvest data for 1978 indicated that breeding population densities were higher in 1979 than in 1978. Limited brood data indicated above average Hun densities for 1979.

The 1979 hunt showed significantly decreased hunting pressure on Huns as compared to 1978. Total hunters, days afield and harvest were well below 1978 and average. Hunter success was below 1978, but near average.

N  
S

### Brood Counts

Results of the annual random brood counts for 1979 are shown in Table 1 of this section. Long-term trends of young-adult ratios, mean brood size and Huns observed per 100 hours are shown in Tables 2-4. Results of the survey for 1979 compared to 1978 and the previous 10-year average follow:

	<u>1979</u>	<u>Percent change from</u>	
		<u>1978</u>	<u>Average</u>
Total Huns observed	53	-61	-78
Young per 100 adults	780	+34	+64
Mean brood size	5.00	-57	- 5
Huns observed per 100 hours	177	+17	-17
Total hours effort	30	-72	-75

Harvest data for 1978 indicated an increased and above average breeding population for 1979.

As a result of greatly decreased efforts, only six broods were observed in 1979. One brood was observed in Juab County near Burriston Ponds.

### Harvest

#### Hunter Questionnaire

Results of the annual hunter questionnaire for 1979 are shown in Table 5. Long-term trends of Huns bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county are found in Tables 6-8 and total statewide harvest statistics in Table 9. The 1979 season compared to 1978 and the previous 10-year average follow:

	<u>1979</u>	<u>Percent change from</u>	
		<u>1978</u>	<u>Average</u>
Hungarian partridge hunters	3,435	-27	-17
Hungarian partridge harvest	6,200	-51	-24
Hunter-days afield	7,787	-37	-29
Huns per hunter-day	.80	-24	+ 8
Huns per hunter	1.80	-34	+ 5

Hungarian partridge hunting pressure and success decreased markedly during 1979 as compared to 1978.

### Field Bag Checks

Results of the survey for 1979 are shown in Table 10. Hunter success trends determined via this method are shown in Table 11. Indexes obtained for 1979 compared to 1978 and the previous 10-year average follow:

	<u>1979</u>	<u>Percent change from</u>	
		<u>1978</u>	<u>Average</u>
Total hunters checked	36	+140	- 66
Total hours hunted	255	+244	- 51
Huns per hunter (complete hunts)	0.13	- 84	- 82
Huns bagged per 100 hours	4	- 75	- 73
Average hours per hunter-day (complete hunts)	3.3	- 33	- 30
Hours hunted per Hun bagged	28 <sup>b</sup>	+351	+294

All the field bag check data was from Box Elder County. The sample was too small to be meaningful.

# **WILD TURKEY**

## **SUMMARY**

Hunter success and turkey observational data for the 1979 spring season indicated a statewide turkey population level considerably below that of 1978 and the long-term average.

Fall hunting pressure statewide was down from 1978 with the total harvest for 1978 being the lowest on record. Both hunter success and total harvest for 1979 were considerably below the long-term average.

### Brood Counts

Annual random brood counts have been conducted each year since the introduction of turkeys into Utah in the early 1950's; however, success in finding broods has usually been poor. Sample sizes have generally been too low to meaningfully indicate relative density or production from year to year. Harvest data for 1978 indicated a decreased breeding population for 1979. No turkey brood observations were reported in 1979.

### Harvest

#### Spring Gobbler Season

Results of the 1979 spring season are shown in Table 1 of this section. The trend of these data since the first season in 1967 is shown in Table 2. The 1979 spring season compared to 1978 and the average follow:

	<u>1979</u>	<u>Percent change from 1978</u>	<u>Average</u>
Permits sold	113	-3	-32
Hunters afield	90	-11	-42
Turkeys harvested	1	-89	-93
Hunter-days afield	237	-4	-39
Percent hunter success	1	-90	-89
Turkeys bagged per hunter-day	0.01	-75	-75
Percent of hunters who observed turkeys	8	-80	-76

Permit sales and hunters afield decreased from 1978 and remained well below average. The total harvest decreased from 12 in 1977 to 9 in 1978 to 1 in 1979. The proportion of hunters who reported having observed turkeys decreased 80 percent below the 1978 level. The East Zion and LaSal units accounted for 71 percent of the hunting pressure based on hunter-days afield. The only turkey reported harvested was taken on the East Zion unit.

The trend of spring turkey harvest statistics is shown in Figure 1.

#### Fall Season

Results of the 1979 fall season are shown in Table 3 of this section. The trend of these data since 1966 are shown in Tables 4-9. The 1979 fall season compared to 1978 and the average follow:

	<u>1979</u>	<u>Percent change from 1978</u>	<u>Average</u>
Permits sold	46	-55	-72
Hunters afield	36	-59	-76
Turkeys harvested	3	-57	-93
Hunter-days afield	71	-68	-80
Percent hunter success	9	0	-59
Turkeys bagged per hunter-day	0.05	+67	-50
Percent of hunters who observed turkeys	19	-50	-46

Permit sales, hunters afield and hunter-days afield all decreased considerably from 1978 and remained well below average. Harvest reached the low of 1973 which was the lowest harvest on record. The percent of hunters observing turkeys decreased by 50 percent from 1978, and was 46 percent below average.

The trend of fall harvest statistics is shown in Figure 2.

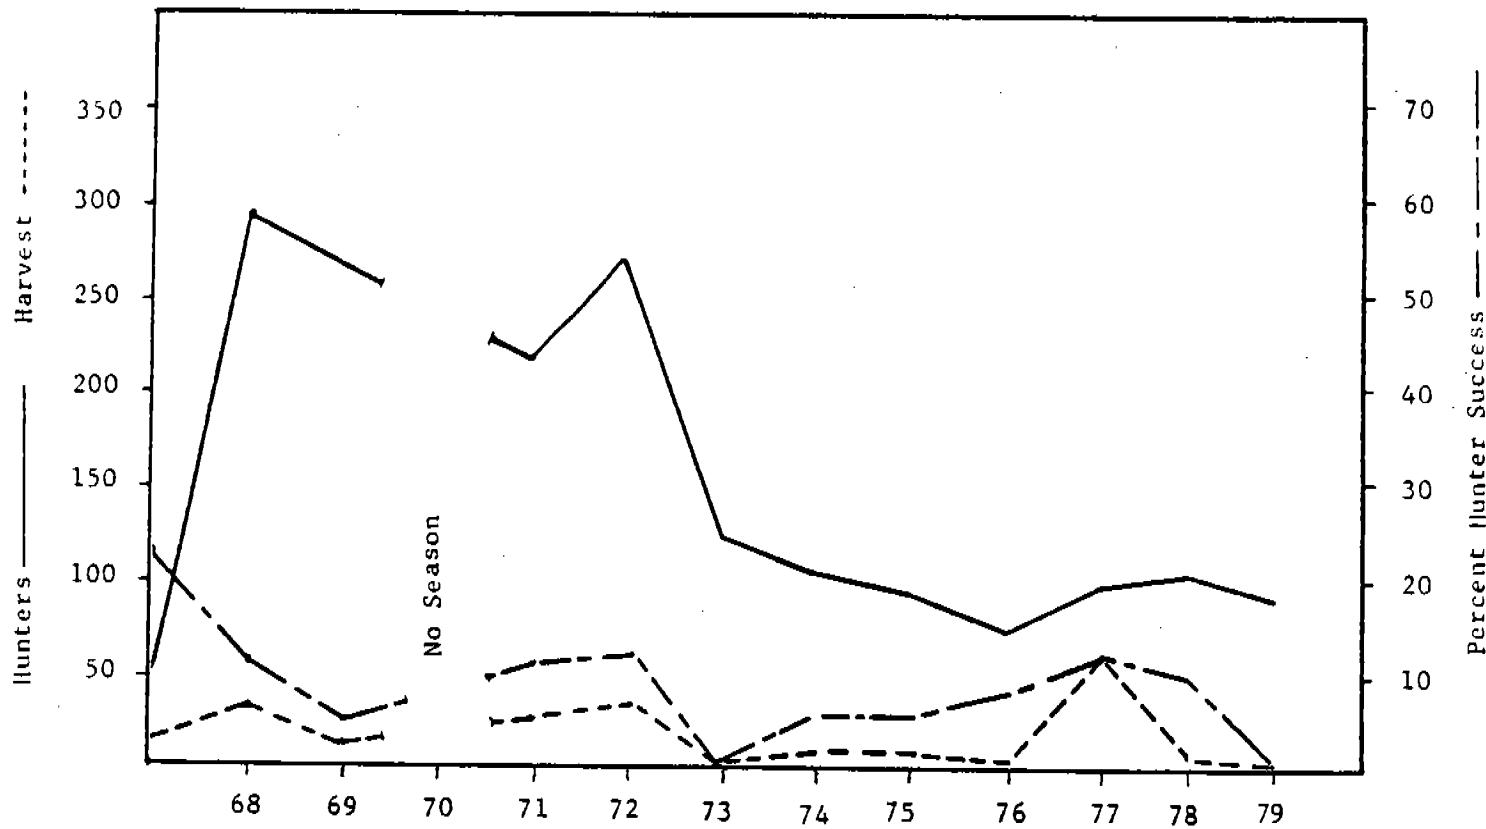

Figure 1. Wild turkey gobbler harvest trends for spring seasons.

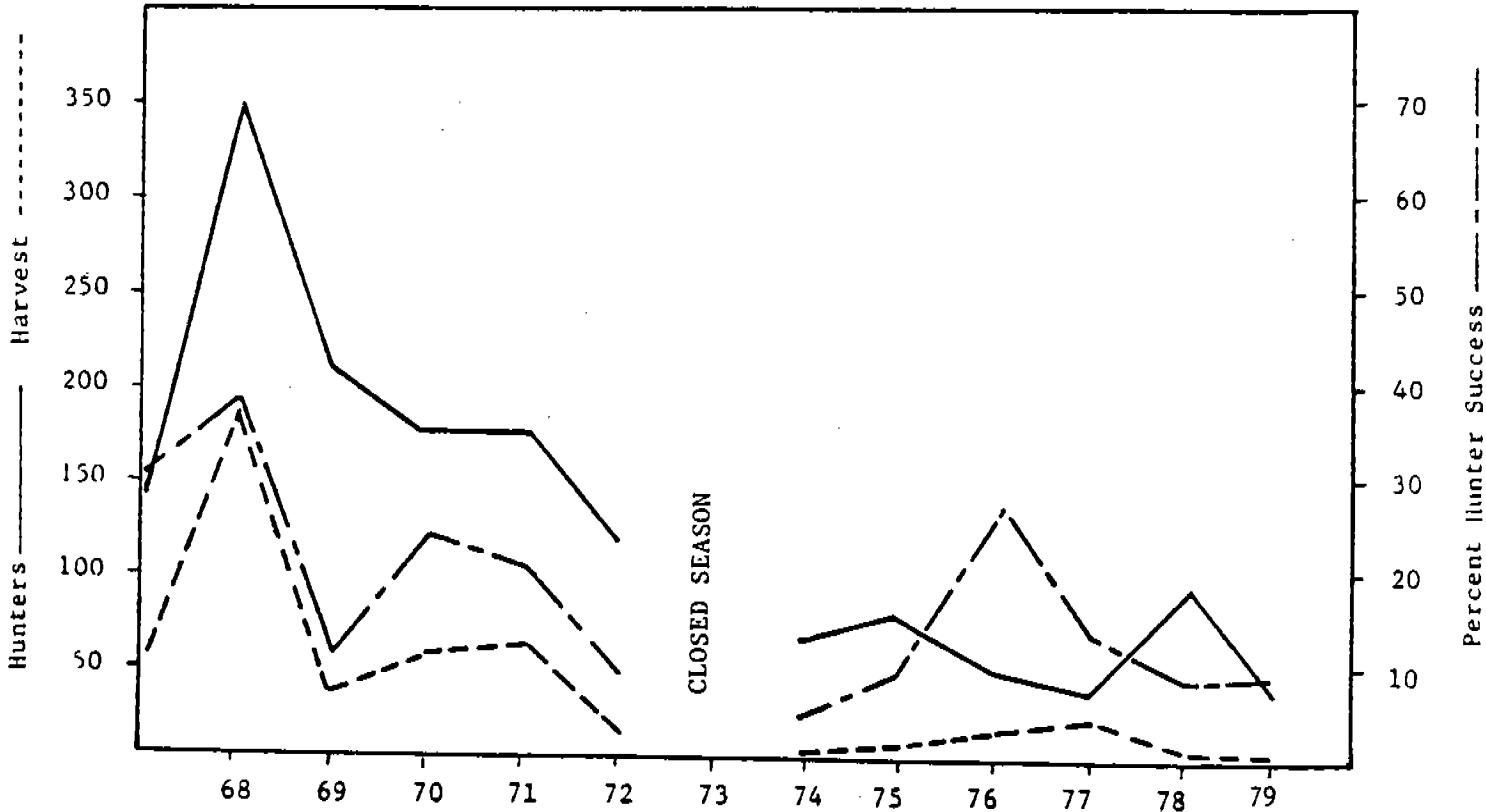

Figure 2. Wild turkey harvest trends for fall seasons.

\*Some hunters hunted more than one area or failed to designate areas hunted. This accounts for the difference between totals given above and combined tables of separate units in Tables 5, 6 and 7.

\*\*During 1968, The Boulder Mountain and East Zion units had two-bird season limits and the LaSal Mountains a one-bird limit; from 1969 through 1972, all areas had a two-bird limit. Hunter success was based on the number of successful hunters rather than total turkeys bagged.

## SHARP-TAILED GROUSE

### Introduction and Summary

The Columbian sharp-tailed grouse is one of four species of grouse native to Utah. Sharptails were formerly abundant in the valley and foothill areas of northern and central Utah. Sharptail grouse habitats were the most attractive areas for agricultural development and grazing in Utah. As a result, sharptail habitat was directly converted to farmland or was seriously impacted by heavy grazing.

Because of habitat loss, sharptails have been extirpated from most of their former range and are now found only in extreme northern Utah, including Box Elder, Cache, Morgan and Weber counties.

In Utah, sharp-tailed grouse were completely protected from hunting from 1925-1973. Beginning in the early 1970's, field reports from various individuals and observations by Division personnel indicated that sharptails were becoming more numerous in several areas. It was felt, at this time, that limited hunting was justified. Limited hunting was legalized in 1974, and has continued since.

The Division has done fairly extensive field work on sharptails since 1975. This work has centered on locating populations and the associated dancing grounds; evaluating habitat use; examining seasonal migration patterns; and monitoring population trends.

Current management of sharptails includes counting of known dancing grounds, searches for new dancing grounds, brood counts and collection of harvest information.

Beginning in 1979, all sharptail hunters were required to obtain a free "Sharp-tailed Grouse Hunting Permit." Questionnaires were sent to all permittees following the season and results are included as Table 3. Harvest figures are not available for the years 1974-1978, but field observations indicate that hunting pressure and harvest were fairly constant during that period and comparable to 1979.

Table 1. Summary of sharp-tailed grouse dancing ground counts, 1975-1979.

# RABBITS AND HARES

## SUMMARY

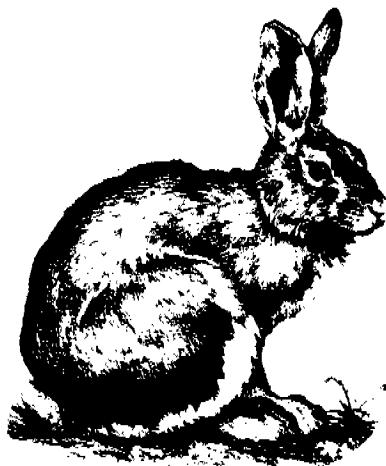

### Cottontail Rabbits

An excellent breeding population level for 1979 was indicated by the 1978 harvest statistics.

Summer roadside counts indicated an increased population density throughout the state except the Northern Region. Harvest statistics indicated a harvest of 200,223 cottontails with 33,385 hunters afield.

### Snowshoe Hares

The 1979 snowshoe hare hunting season was the fifth held since the Legislature provided protected status to this species in 1975.

Harvest statistics for 1979 indicated decreased hunter participation, hunter success and total harvest. However, this decrease may reflect more accurate identification of the snowshoe hare by hunters as a result of education efforts, rather than an actual decline in hunter participation. Nevertheless, some hunters still identify whitetail jackrabbits as snowshoe hare, causing some bias in the data.

## COTTONTAIL RABBIT

### Roadside Counts

Results of the annual roadside counts for 1979 are shown in Table 1 of this section. The trend of cottontails observed per mile and young per 100 adults since 1969 is shown in Table 2 and 3, respectively. Indexes for 1979 compared to 1978 and the average follow:

	<u>1979</u>	<u>Percent change from 1978</u>	<u>Average</u>
Total miles driven	2,486	- 9	- 6
Total cottontails counted	1,094	-16	+14
Cottontails observed per mile	0.44	- 6	+26
Young observed per 100 adults	121	+ 8	+11

A good breeding population for 1979 was indicated by 1978 harvest statistics.

Indicated production was above 1978 and the average.

The cottontail per mile index was up in all regions, except the Northeastern and Southeastern regions. The index was above average statewide in all areas except the Northern and Southeastern regions.

### Harvest

#### Hunter Questionnaire

Results of the 1979 hunter questionnaire are found in Table 4. Trends of cottontails bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) by county since 1973 are found in Tables 5-7. Trends of statewide harvest statistics are found in Table 8 and Figure 2. Results of the 1979 season compared to 1978 and the average follow:

	<u>1979</u>	<u>Percent change from 1978</u>	<u>Average</u>
Cottontail hunters	33,385	- 6	+23
Cottontail harvest	200,223	-50	- 1
Hunter-days afield	127,497	-22	+10
Cottontails per hunter-day	1.57	-36	- 8
Cottontails per hunter	6.00	-47	-17

Total harvest and total days afield both decreased from 1978. Total hunters decreased slightly from 1978, but success decreased significantly to 8 percent below average.

### Field Bag Checks

Results of the survey for 1979 are shown in Table 9. Trends of hunter success as determined by bag checks are shown in Table 10. Following is a comparison of the 1979 field bag check data to 1978 and the average.

		Percent change from	
	1979	1978	Average
Total hunters checked	240	-55	-48
Total hours hunted	531	-69	-59
Cottontails per hunter (complete hunts)	1.85	-52	- 9
Cottontails bagged per 100 hours	60	-44	+ 5
Hours per hunter-day (complete hunts)	2.8	-28	-18
Hours per cottontail bagged	1.7	+89	-11

Fifty-five percent fewer cottontail hunters were checked in 1979 than in 1978. Field bag check data indicated that success decreased dramatically from 1978 to about average. Hunters spent less time afield, and the time required to bag a cottontail increased 89 percent. Hunter success was generally down in all regions except the Central Region according to field bag check data.

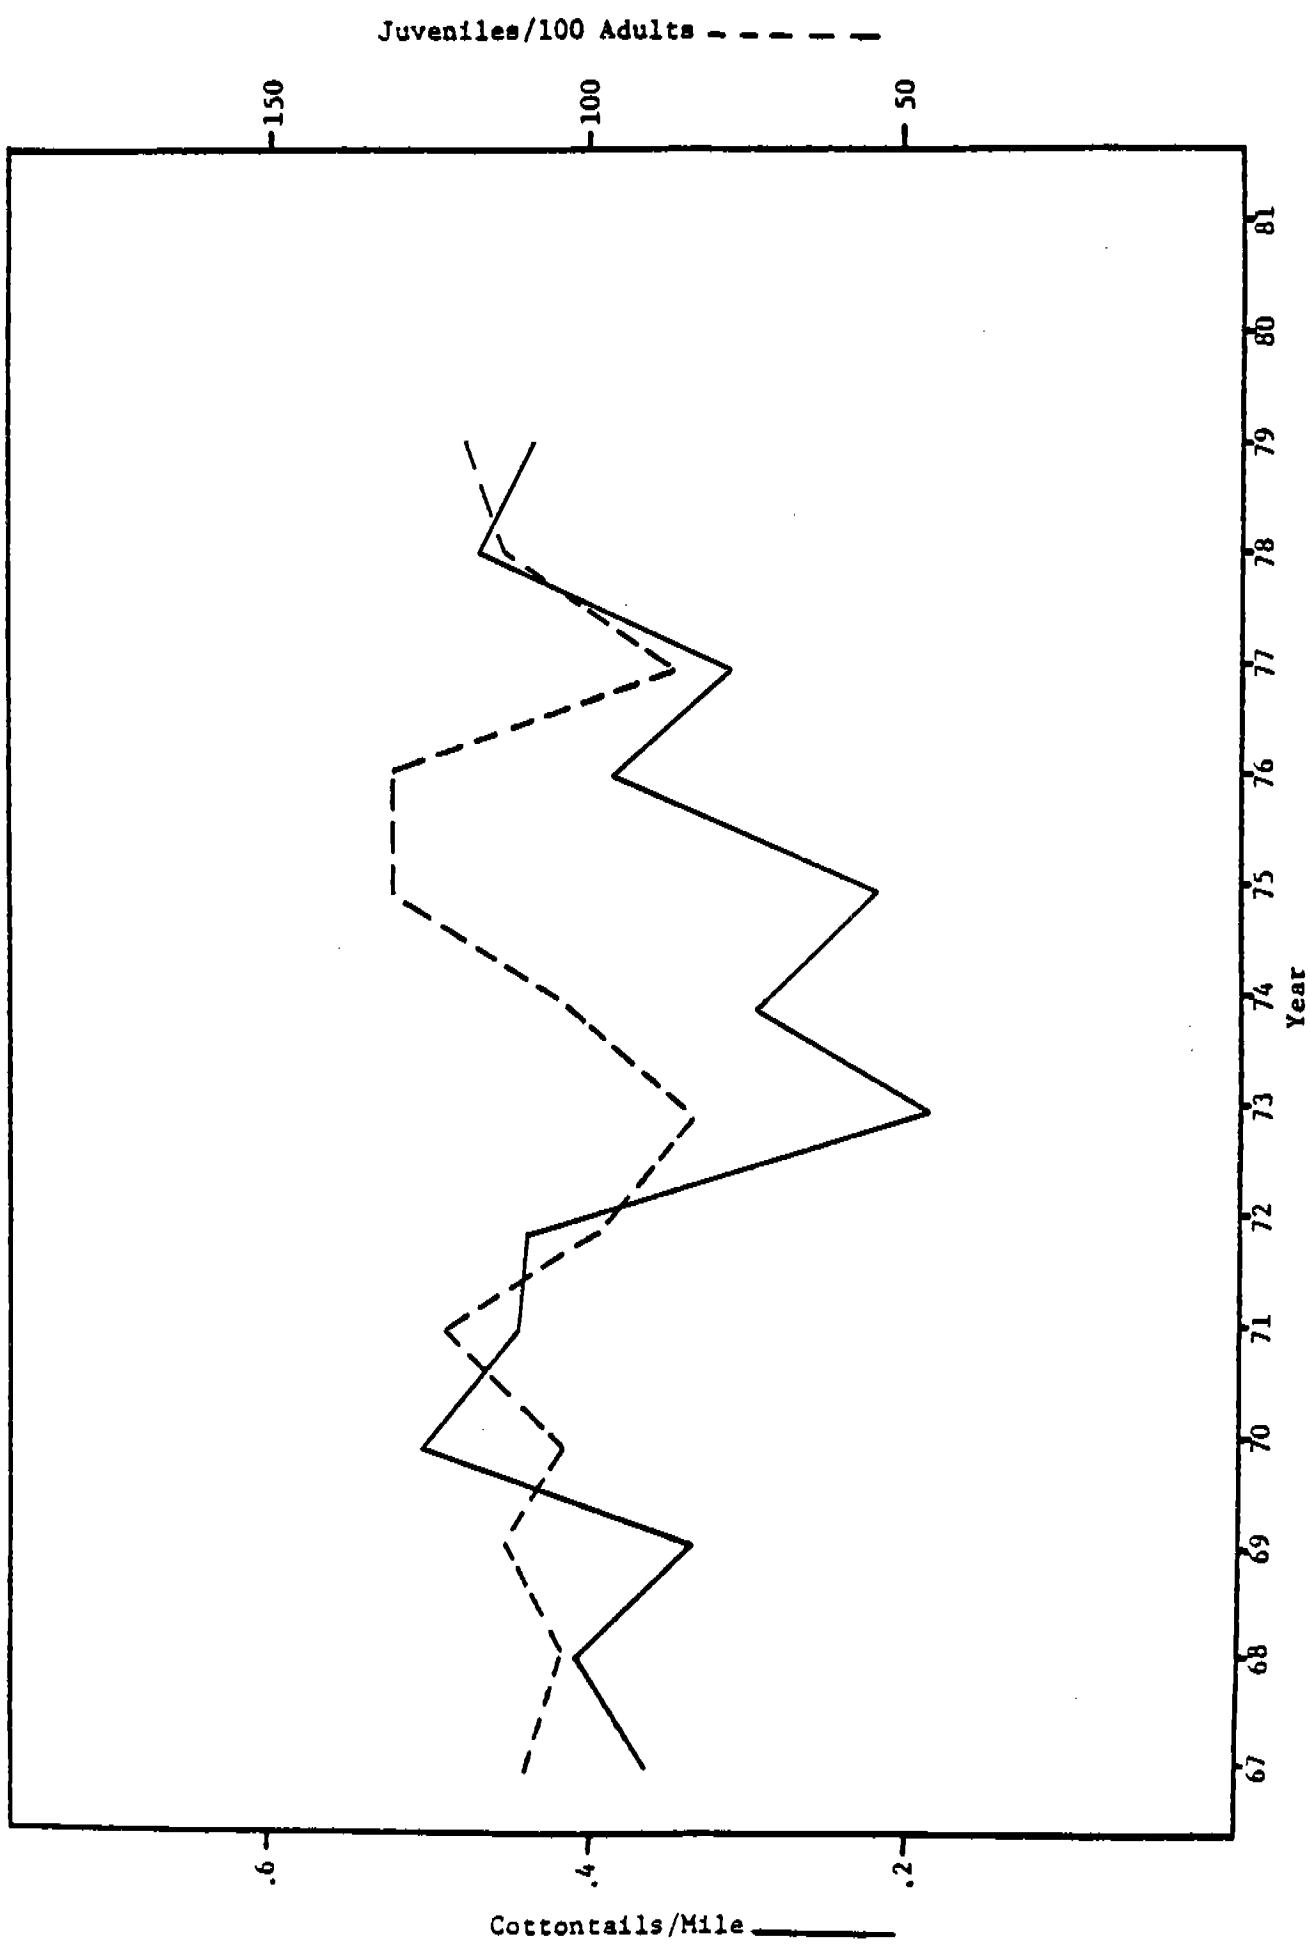

Figure 1. Cottontail Rabbit Population Indexes Trend.

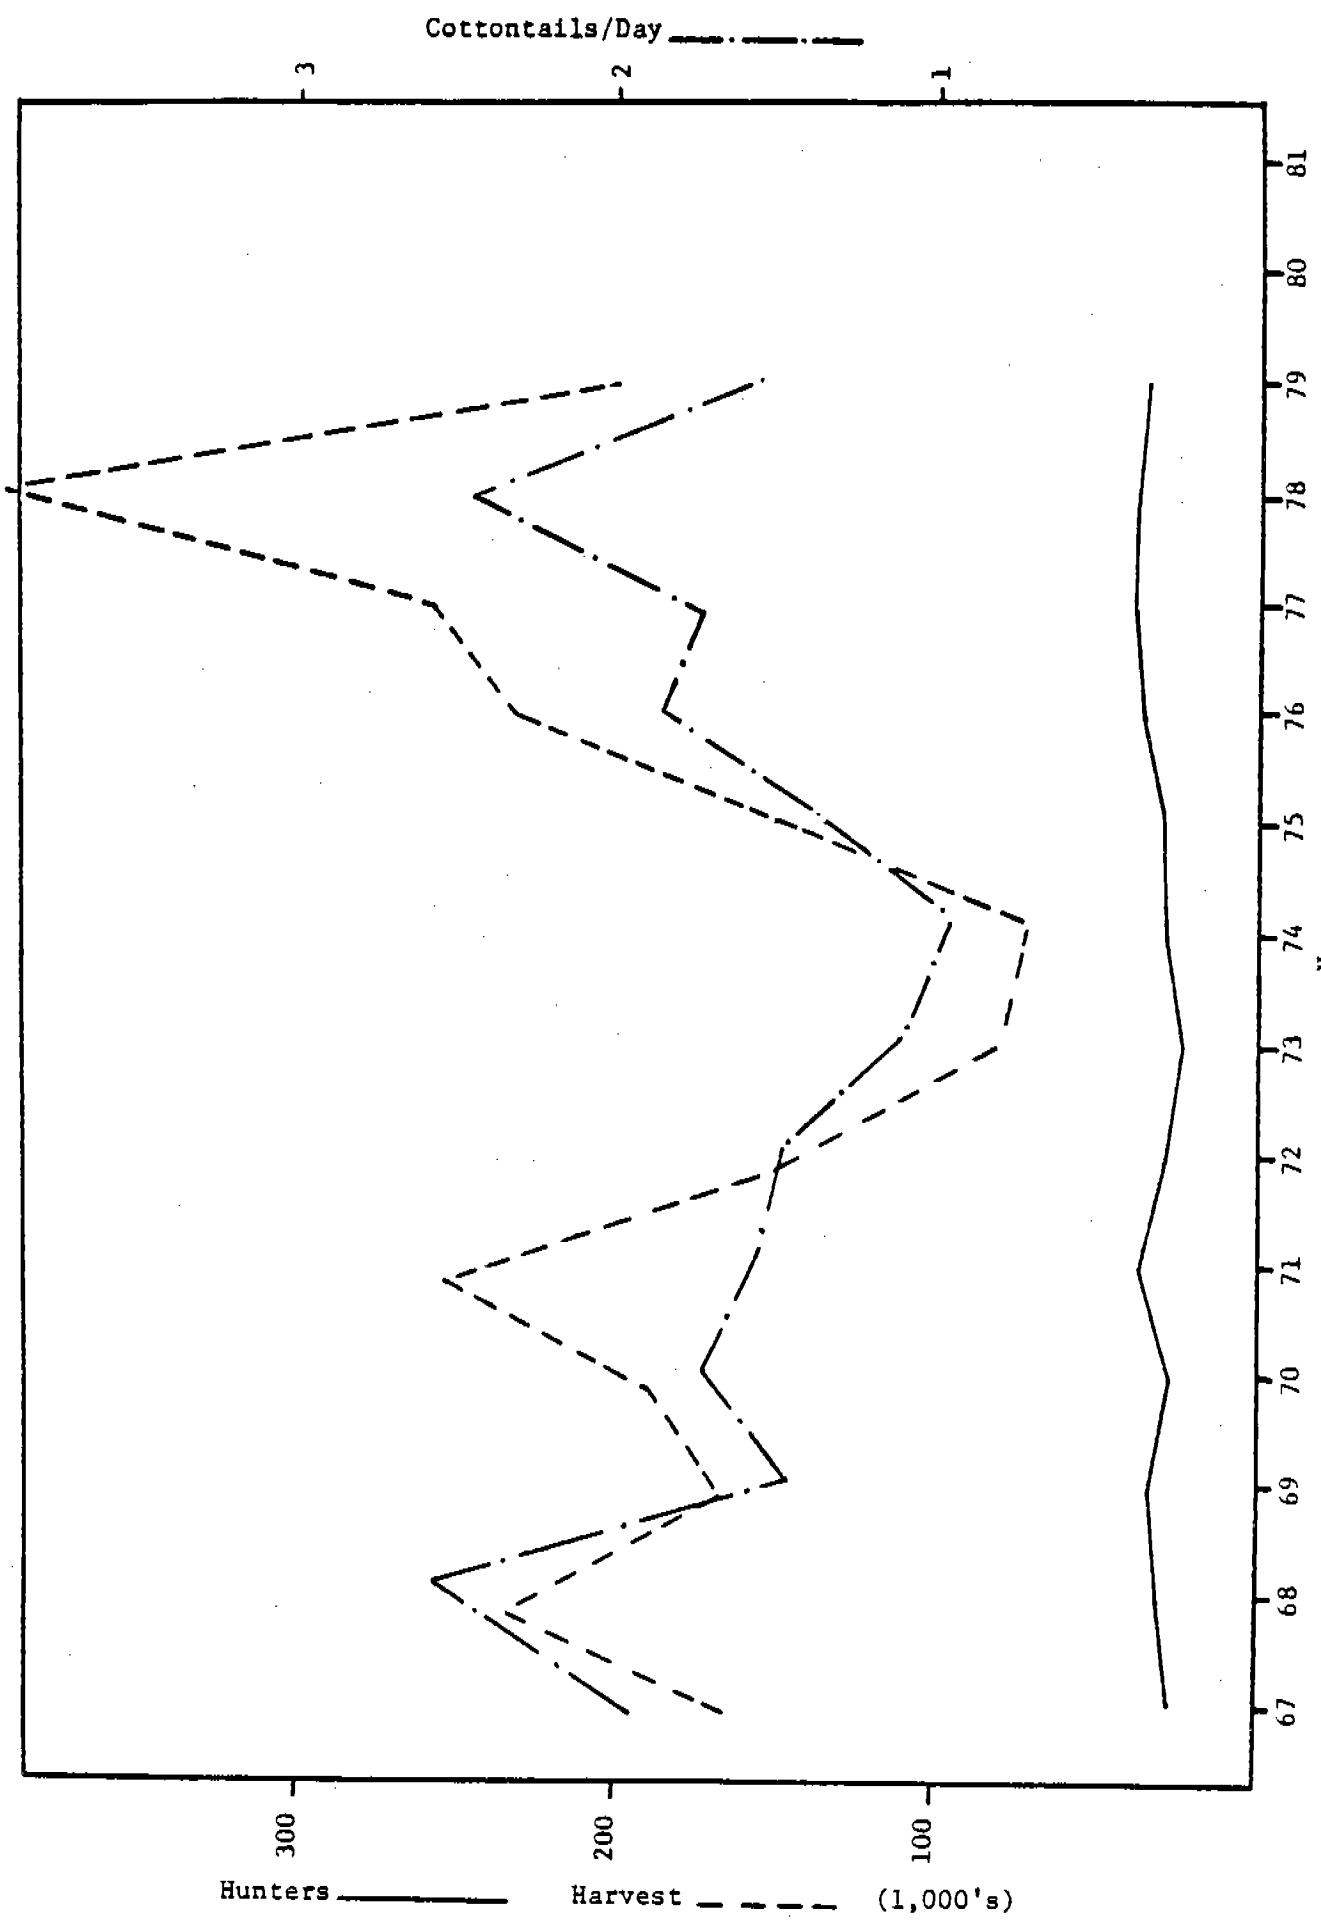

Figure 2. Cottontail Rabbit Harvest Trend

## SNOWSHOE HARE

### Harvest

During 1979, the fourth annual snowshoe hare hunting season was held statewide. Results of the 1979 hunter questionnaire are found in Table 11. Trends of snowshoe hares bagged per hunter-day, percent of harvest and percent of pressure (hunter-days) are found in Tables 12-14. The 1979 season compared to the season in 1978 and the average of the first four hunts as follows:

	<u>1979</u>	<u>Percent change from 1978</u>	<u>Average</u>
Snowshoe hare hunters	6,787	-17	-16
Snowshoe hares harvested	14,641	-58	-30
Hunter-days afield	18,115	-40	-25
Snowshoes per hunter-day	0.81	-30	-2
Snowshoes per hunter	2.16	-49	-16

Significant misidentification of whitetail jackrabbits as snowshoe hares was anticipated prior to mailing the harvest questionnaire following the first season in 1975. This proved to be the case as a significant harvest of snowshoe hares was reported for counties outside the known range of the species. It was assumed that the problem was statewide, not just confined to those counties.

The 1976 harvest questionnaire was modified in an attempt to better inform respondents concerning the potential for misidentification and aid them in distinguishing between these two varying hares. Comparative reported harvests between 1975 and 1976 suggest that this was accomplished, at least to a significant degree, but the relatively large harvest in counties outside of the snowshoe's range suggested continued confusion. Further refinement was made in the 1977 harvest questionnaire in an effort to more clearly define the snowshoe hare harvest.

In 1978, a leaflet containing pictures and descriptions of the different species of hares found in Utah was mailed with the questionnaire. As a result of the identification leaflet, it is assumed that the data has been more accurate.

Results of the 1979 questionnaire indicate a 17 percent decrease in snowshoe hare hunters, and a 58 percent decrease in harvest compared to 1978.

It is unknown what proportion of the reported snowshoe harvest was actually whitetail jackrabbits incorrectly identified by the hunters. However, it is believed that identification has been improving as a result of efforts to educate the hunter on the differences between the various species of hares found in Utah.

Hopefully, the decrease in hunters afield and harvest reflects more accurate identification rather than a significant decline in hunter participation and harvest.

Table 6. Season framework for upland game during 1979.

Species	Season Dates	Daily Bag Limit	Possession Limit	Area Open
Pheasant	Nov. 3-11	2 cocks	4 cocks	Statewide except Daggett, Duchesne and Uintah counties.
	Nov. 3-16	2 cocks	4 cocks	Daggett, Duchesne and Uintah counties.
	Nov. 3 - Dec. 2	2 cocks	4 cocks	All state and federal lands subject to restrictions and closures imposed by administering agencies, in Box Elder, Davis, Duchesne, Uintah and Weber counties.
Mourning dove	Sept. 1-30	10	20	Statewide.
Band-tailed pigeon	Sept. 1-30	5	10	Grand, San Juan, Beaver, Garfield, Iron, Kane, Millard, Piute, Sevier, Washington and Wayne counties.
Chukar	Sept. 15, 1979 - Jan. 31, 1980	5	10	Kane, San Juan and Tooele counties, and portions of Box Elder, Davis, Juab, Millard, Salt Lake, Utah and Weber counties.
	Sept. 15 - Nov. 30	5	10	Statewide.
Sage grouse	Sept. 15-21	3	6	Beaver, Garfield, Grand (part), Iron, Kane, Millard, Piute, Sevier, Uintah (part) and Wayne counties.
	Sept. 15-21	2	4	Carbon, Daggett, Duchesne, Emery, Grand (part), San Juan, Sanpete (part), Uintah (part), Utah (part), Wasatch (part) and Box Elder (part).
	Sept. 15-21	1	2	Box Elder (part), Cache, Davis, Morgan, Rich, Summit, and Weber counties.
	Sept. 15-16	1	2	Wasatch County (part).

Table 6. Continued.

Species	Season Dates	Daily Bag Limit	Possession Limit	Area Open
	The following counties were closed to sage grouse hunting during 1979:			Salt Lake, Sanpete (part), Washington, Utah (part), Juab and Tooele.
Forest grouse	Sept. 15 - Nov. 30	4 aggregate	8 aggregate	Statewide.
Quail	Nov. 3-11	5	10	Statewide except Daggett, Duchesne, Grand, Uintah and Washington counties.
	Nov. 3-16	5	10	Daggett, Duchesne and Uintah counties.
	Nov. 3 - Dec. 31	8	16	Washington County.
	Grand County was closed to quail hunting in 1979.			
Hungarian partridge	Sept. 15, 1979 - Jan. 31, 1980	5	10	Kane, San Juan and Tooele counties. Parts of Box Elder, Davis, Juab, Millard, Salt Lake, Utah and Weber counties.
	Sept. 15 - Nov. 30	5	10	Statewide.
Wild turkeys	April 28 - Spring hunt May 20	Season limit 1 male turkey		Garfield, Grand, Iron, Kane, San Juan, Washington and Wayne counties.
Fall hunt	Sept. 15-30	Season limit 1 turkey of either sex		Grand, Iron, Kane, San Juan, and Washington counties.
Snowshoe hare	Sept. 15, 1979 - Jan. 31, 1980	5	10	Statewide.
Cottontail rabbit	Sept. 15, 1979 - Jan. 31, 1980	10	20	Statewide except Box Elder, Cache, Daggett, Davis, Duchesne, Morgan, Rich, Summit, Uintah and Weber counties.

Table 6. Continued.

Species	Season Dates	Daily Bag Possession		Area Open
		Limit	Limit	
Cottontail rabbit (continued)	Sept. 15, 1979 - Jan. 31, 1980	5	10	Box Elder, Cache, Daggett, Davis, Duchesne, Morgan, Rich, Summit, Uintah and Weber counties.
